

Smart Warranty Hub: Easy OEM Intelligence Flow

Prepared on: 2026-02-28

1) What data is used

- User invoice and product details
- OEM issue feed and official updates
- Peer web reviews and sentiment trends
- User behavior and usage signals
- Region policies (country/market rules)

2) How prediction works (simple)

Step A: System reads invoice and warranty terms.

Step B: It adds OEM signals, peer web signals, behavior, and region rules.

Step C: AI risk engine creates risk score + early warning forecast.

Step D: User gets preventive guidance; OEM gets dashboard insights.

3) OEM action cycle

- Weekly analysis: check trends and risk movement.
- Monthly dispatch: send recommendation only if signal is strong.
- If signal is weak: do not spam user; notify OEM as 'not conclusive'.
- All actions are logged for trace and KPI tracking.

4) Charts OEM can understand quickly

- Risk Distribution Chart (low / medium / high)
- Forecast Trend Chart (future risk direction)
- Behavior Snapshot Chart (care / responsiveness)
- Top Peer Keywords and Issues panel

5) One-line summary for OEM

We combine user, OEM, web-peer, behavior, and region signals to predict issues early and trigger safe, timely actions.
